1. Introduction

South Africa's agricultural sector sustains millions of people across the country and is central to food security, livelihoods, and economic development. Yet, small-scale and smallholder farmers who make up about 95% of farming operations remain among the most economically vulnerable (Statistics South Africa, 2021). On average, they receive only 20 to 30 cents of every rand spent by consumers on fresh produce, as the majority is absorbed by intermediaries, wholesalers, logistics operators, and large supermarket chains (Greenberg, 2017). These farmers, particularly in rural and peri-urban areas, face persistent barriers to accessing formal markets, including limited digital tools, reliance on middlemen, and difficulties in reaching consumers directly (Chikazunga & Paradza, 2012). Consequently, they earn reduced profits, while inefficiencies in distribution contribute to significant food loss and waste.

At the same time, millions of South African consumers, especially those in urban townships and low-income areas, are paying inflated prices for produce that isn't always good quality and often comes from faraway commercial farms with little information about where it comes from, how fresh it is, or how it was grown (Battersby & Watson, 2019). Still, many urban consumers are looking for fresh, affordable, and locally grown fruits and vegetables. Despite this demand, a disconnect persists between consumers and small-scale farmers, with few accessible platforms enabling direct, transparent, and efficient transactions (Crush & Frayne, 2011). This results in a broken food system which disadvantages both ends of the supply chain: farmers struggling to earn fair returns and consumers burdened with high costs and limited choice.

Green Bridge is a farm-to-consumer eCommerce marketplace created to repair South Africa's fractured food system by directly linking verified farmers with consumers in their cities and towns. By removing unnecessary intermediaries, the platform ensures that producers retain more value, while buyers receive fresher, higher-quality produce through a transparent supply chain. The name "Green Bridge" embodies this mission: it bridges the gap between agricultural producers and consumers, promotes environmentally sustainable practices ("green"), and strengthens local food systems. In doing so, Green Bridge advances not only economic empowerment for farmers but also broader social impact goals, including food security, sustainability, and community development.

1.1 The Social Problem

South Africa's small-scale farmers are vital to local food production, yet they remain among the most economically vulnerable actors in the agricultural value chain (Statistics South Africa, 2021). Despite producing fresh and affordable goods, they struggle to access formal markets where fair and competitive prices can be secured. Instead, they are often forced to sell at wholesale rates far below market value, typically to a single buyer with significant bargaining power.

This reliance on intermediaries such as wholesalers, informal traders, and centralised distribution systems, limits farmers' earning potential, reduces their bargaining power, and perpetuates income inequality. The majority of smallholder farmers are excluded from digital platforms, leaving them invisible to potential direct buyers and unable to participate in the growing e-commerce economy. Barriers such as limited resources, digital literacy challenges, and inadequate technological support further deepen this exclusion (Bontsa et al., 2023).

Food waste compounds the problem: South Africa discards approximately 10.2 million tonnes of food annually (WRAP, 2024), much of it due to poor cold-chain logistics and the inability of small farmers to reach urban markets efficiently. Without reliable demand forecasting or stable market access, farmers often face surplus produce that goes unsold, resulting in financial losses and systemic inefficiencies (Ahumada & Villalobos, 2009).

On the consumer side, urban households, particularly in townships and lower-income areas, pay retail markups of 200-400% on fresh produce, despite being located near productive farmlands (Battersby & Watson, 2019). Consumers also face limited transparency about the origin, quality, and fairness of their food supply. Although demand for fresh, locally sourced produce is rising, existing retail systems fail to connect consumers with small-scale producers in a direct and efficient way.

Overall, these interconnected challenges; farmer income inequality, food insecurity and waste, consumer price exploitation, market opacity, and digital exclusion, reflect a broader structural issue within South Africa's agricultural ecosystem.

1.2 The Solution

To address the challenges faced by small-scale farmers and the disconnect between producers and consumers, this project proposes the development of Green Bridge, a social impact e-commerce

platform designed to facilitate direct, efficient, and transparent transactions within the agricultural sector.

Green Bridge functions as a farm-to-consumer digital marketplace where small-scale farmers can list and sell their produce directly to customers. Through the platform, farmers are able to create profiles, upload available products (such as fruits, vegetables, and other fresh goods), set prices, and manage incoming orders. This eliminates the need for intermediaries, allowing farmers to retain a larger share of the profits and gain greater control over their sales (Vorst & Beulens, 2002).

For consumers, Green Bridge provides a user-friendly interface that enables them to browse locally sourced produce, compare prices, and purchase items directly from farmers. The platform includes standard e-commerce functionalities such as product listings, search features, a shopping cart, and a checkout system, ensuring a familiar online shopping experience (Turban et al., 2018).

In addition to this, Green Bridge introduces an innovative Smart Surplus Alert system, designed to address the issue of excess and unsold produce. When farmers experience surplus stock, the platform automatically highlights these items as discounted “surplus deals” and notifies consumers of their availability. This feature encourages quicker purchasing decisions, reduces food waste, and provides consumers with access to more affordable produce.

The platform also incorporates flexible fulfilment options, including local delivery coordination and community-based collection points. These options make it easier for both farmers and consumers to participate in the platform, even in areas with limited logistics infrastructure.

Furthermore, Green Bridge promotes transparency and trust by allowing consumers to view information about the farmers they are purchasing from, including location, farming practices, and customer reviews. This strengthens the relationship between producers and consumers while encouraging more sustainable and ethical purchasing decisions.

Overall, Green Bridge provides a practical and scalable solution that leverages e-commerce technology to empower small-scale farmers, improve market access, reduce inefficiencies in the food supply chain, and enhance access to affordable, fresh produce for consumers.

2. Business Model Canvas

GREEN BRIDGE Business Model Canvas <i>A Farm-to-Consumer Marketplace for Mzansi by Mzansi</i>				
 Key Partners	 Key Activities	 Value Propositions	 Customer Relationships	 Customer Segments
SUPPLIERS & ALLIES - Small-scale farmers (primary suppliers) - Local delivery providers & courier startups - Community collection points (spaza shops, community centres) - Agricultural NGOs & cooperatives (AgriSA, DAFF) WHAT WE GIVE THEM - Increased market access - Revenue opportunities - Digital visibility WHAT WE RECEIVE - Produce supply - Logistics support - Community trust and reach	- Platform development and maintenance - Farmer onboarding and training - Product listing and inventory management - Order processing and coordination - Smart Surplus Alert monitoring system - Marketing and user acquisition Key Resources FINANCIAL - Startup budget: R30,000 - R60,000 HUMAN - Developer (primary) - Customer support / admin - Marketing / social media manager TECHNOLOGY - Web hosting & domain - Database system - Payment integration (PayFast /Yoco)	FOR FARMERS - Direct-to-consumer selling (no intermediaries) - Increased income margins - Reduced waste via Smart Surplus Alerts FOR CONSUMERS - Affordable fresh produce - Access to local farmers - Discounted surplus deals - Transparent sourcing ("know your farmer") SIGNATURE FEATURES <i>Smart Surplus Alert System: real-time push alerts connect surplus stock to buyers, reducing waste while delivering deals.</i> <i>The Farm Story: a human-centred content module that surfaces the farmer's identity, geography, philosophy, and growing practice</i>	- User profiles and accounts - Ratings and reviews - Notifications (orders + surplus alerts) - Customer support (email / chat) - Loyalty incentives (future feature) Channels - Web application (primary) - Mobile-friendly interface - Social media (Facebook, Instagram, WhatsApp groups) - Community outreach programmes	PRIMARY - Urban consumers (budget-conscious households) - Small-scale farmers SECONDARY - Restaurants & informal traders - NGOs / community feeding schemes GROWTH TARGETS - USERS - Month 3: 50-100 active users - Month 6: 300+ active users - Year 1: 1,000+ active users GROWTH TARGETS - FARMERS - Month 3: 10 farmers onboarded - Month 6: 30+ farmers - Year 1: 100+ farmers

Cost Structure

Cost Item	Est. Cost (ZAR)	Source / Assumption
Domain + Hosting (annual)	R1,500 - R3,000	Afrihost, Domains.co.za
Website Development	R0 - R20,000	Self-developed (R0) or freelance
Marketing (social media ads)	R2,000 - R5,000/month	Meta Ads entry-level
Operations / Admin	R3,000/month	Basic support/admin stipend
Logistics Coordination	R5,000/month	Local delivery partnerships
Maintenance & Updates	R1,000/month	Minor updates and fixes

Total Estimated Monthly Cost: R10,000 - R15,000 / month

Revenue Streams

Revenue Source	Model	Est. Earnings	Assumption
Commission per sale	10% per transaction	R5,000 - R15,000/month	100-300 orders @ avg R150
Delivery / service fee	R10 - R30 per order	R2,000 - R6,000/month	Based on order volume
Featured listings (farmers)	R100/month	R1,000/month	10 farmers paying
Subscription boxes (future)	R200 - R400/month	R4,000/month	20 subscribers

Estimated Monthly Revenue: R8,000 - R26,000 / month

TRANSACTION METRICS

- Early stage: 100-300 orders / month
- Growth stage: 500+ orders / month

IMPACT METRICS

- Reduction in unsold produce and food waste (tracked via surplus system)
- Increase in farmer income

SCALABILITY STRATEGY

- Add mobile app version
- Introduce subscription-based produce boxes
- Partner with larger logistics providers

3. User Experience Design Analysis

This section presents the UX research underpinning Green Bridge's design decisions. It includes two user persona reports representing the platform's primary user archetypes, the consumer and the farmer, followed by a Hierarchical Task Analysis (HTA) of the core purchasing journey.

3.1 User Persona 1: The Small-Scale Farmer

Persona 1: Small-Scale Farmer

Hlumelo Bhayi

Age	45
Location	Mthatha, Eastern Cape (rural area)
Occupation	Small-scale vegetable farmer
Monthly Income	R6,000 - R11,000 (highly seasonal)
Device	Samsung Galaxy A14 WhatsApp Daily User

"I grow food that feeds the city. But the city does not know my name. If they could see my farm and buy from me directly, everything changes. My children could go to university."

Background

Hlumelo grows spinach, tomatoes, and cabbage on his small farm in the Eastern Cape. He currently sells his produce to local traders at low prices and consistently struggles with unsold surplus, produce that goes to waste and directly reduces his household income. He is eager to connect with buyers directly but lacks access to the platforms and networks that would make this possible.

Goals

- Sell produce at better prices
- Reach more customers beyond local traders
- Reduce waste from unsold crops
- Have predictable, consistent demand

Pain Points

- Limited access to formal markets
- Low profits due to intermediaries taking margins
- Unsold produce leading to direct income losses
- Limited experience with digital platforms

💡 Needs from Green Bridge

- Simple, low-step product listing process
- Ability to update stock quickly and easily
- Notifications for incoming orders
- Automated alerts when surplus stock builds up

📱 Digital Behaviour

- Uses smartphone for basic apps (primarily WhatsApp)
- Prefers simple, visually clear interfaces
- Needs minimal steps to complete any action
- Low tolerance for confusing navigation or jargon

UX Design Implication

Hlumelo represents a low-digital-literacy user. Green Bridge's farmer-facing interface must prioritise large tap targets, icon-driven navigation, minimal text input, and WhatsApp-style notification flows. Onboarding must be achievable in under 5 minutes with guidance built directly into the interface and not in a separate help section.

3.2 User Persona 2: The Urban Consumer

🛒 Persona 2: Urban Consumer

Aaliyah Wilson

Age	29
Location	Lavender Hill, Cape Town
Occupation	Working professional
Monthly Income	R22,000
Device	iPhone 16 Frequent mobile shopper

"I want to know who grew my spinach. If I can see a photo of the farmer and understand where it came from, I am happy to pay more for it. That is what trust looks like."

🔗 Background

Aaliyah is a young working professional based in Lavender Hill, Cape Town. She prefers buying fresh, affordable produce but finds supermarket prices increasingly high and the sourcing of food opaque. She is a confident and frequent user of online shopping platforms and mobile apps, responding well to personalised deals and notifications. She is willing to pay a premium for produce when she can see where it comes from.

🎯 Goals - Buy affordable, fresh produce conveniently - Support local farmers directly - Shop online without friction - Find good deals, especially on surplus stock	🚫 Pain Points - High food prices at formal supermarkets - Lack of transparency in food sourcing - Limited access to local farmer produce - No alerts for discounts or surplus deals
💡 Needs from Green Bridge - Easy browsing and product search - Clear pricing, product info, and farmer profiles - Discounts and surplus deal notifications - Quick, frictionless checkout process	📱 Digital Behaviour - Shops online frequently and confidently - Uses mobile apps daily across multiple categories - Responds well to push notifications and deal alerts - High expectations for UI polish and speed

UX Design Implication

Aaliyah represents a high-digital-literacy, trust-driven buyer. Green Bridge's consumer-facing interface should feature farmer profile photos, farm location context, and transparent sourcing stories to build confidence. Surplus Alert push notifications and recommended deal feeds will be key engagement and retention mechanisms for this segment.

3.3 Persona Comparison Summary

Dimension	👨‍🌾 Hlumelo Bhayi (Farmer)	🛒 Aaliyah Wilson (Consumer)
Age	45	29
Location	Mthatha, Eastern Cape (rural)	Lavender Hill, Cape Town (urban)
Income	R6,000 - R11,000/month	R22,000/month
Device	Samsung Galaxy A14	iPhone 16
Digital literacy	Low - basic apps only	High - frequent online shopper
Primary goal	Sell produce at better prices	Buy affordable, traceable food
Biggest pain point	Intermediaries cutting margins	No transparency in food sourcing
Key need from Green Bridge	Simple listing + surplus alerts	Farmer profiles + quick checkout
Notification sensitivity	Order alerts via simple push/SMS	Surplus deals + personalised feeds
UX priority	Minimal steps, icon-driven UI	Polish, speed, trust signals

3.4 Hierarchical Task Analysis (HTA)

The HTA below maps the task hierarchy for a consumer placing a fresh produce order on Green Bridge. The overarching goal, purchasing fresh produce via Green Bridge, is decomposed into six sub-goals, each detailing the operations a user must perform to complete the task.

Goal: Purchase fresh produce via Green Bridge

The process begins with discovery (1.1), where the user navigates to the Green Bridge website and encounters the platform's mission, featured produce, and value proposition. The user then searches and browses the marketplace (1.2), applying category, location, and sorting filters to narrow results to relevant listings. In sub-goal 1.3, the user evaluates a specific product by reading its Farm Story, a unique Green Bridge feature that surfaces the farmer's name, photograph, geographic location, growing method, and personal narrative, alongside customer reviews and delivery information. Once satisfied, the user adds one or more products to their basket (1.4), adjusting quantities and removing items as needed before proceeding to checkout (1.5), where delivery details, preferred date, contact information, and payment method are captured, and any applicable discount codes are applied. The process concludes with the user placing the order (1.6), triggering an automated confirmation screen, a farmer notification via WhatsApp, and a confirmation email to the consumer containing the order reference and estimated delivery date.

This task structure reflects the design principles of the Green Bridge platform: minimising steps to purchase, surfacing trust signals at the evaluation stage, and ensuring that the farmer's identity and story are central to the consumer's decision-making process rather than an afterthought.

4. Wireframes

Green Bridge's wireframes were developed in response to design principles derived directly from the user persona research.

4.1 Wireframe 1: Homepage

Annotations:

- *Hero section: full-width editorial layout with headline, subheading, and dual CTA buttons ("Shop Now" / "Farm stories"); designed for Aaliyah's expectation of a polished first impression*
- *Category grid: icon-driven visual tiles linking to filtered shop pages; supports both Hlumelo's simple navigation needs and Aaliyah's expectation of fast browsing*
- *"Fresh this week" product strip: featured products with farmer attribution visible on card; directly addresses Aaliyah's pain point of opaque food sourcing*
- *Farm story spotlight section: introduces the human behind the produce before checkout, aligning with HTA step 1.3 (evaluate product and read Farm Story)*

4.2 Wireframe 2: Shop & Product Page

Annotations:

- *Sidebar filter panel: category, price range, organic/surplus/pre-order toggles, and province filter; maps directly to HTA step 1.2 (search and browse marketplace)*
- *Results count and sort dropdown: gives users immediate feedback on filtered results; supports Aaliyah's expectation of frictionless browsing*
- *Product card: image, farmer name, location, price, rating, and "Add to cart" button all visible without clicking through; reduces steps per HTA design principle*
- *Product detail page: breadcrumb trail, gallery with farmer and farm images, spec grid (category, origin, stock, method), and quantity selector; all elements serve HTA step 1.3 (evaluate product)*

4.3 Wireframe 3: Cart & Checkout

WF-03 Cart & Checkout

Annotations:

- Cart item layout: product image, farmer name, quantity controls (+/-), remove button, and line total; designed for quick review per HTA step 1.4 (add products to basket)
- Order summary sidebar: subtotal, delivery fee (free above R250 threshold), promo code input, and total; surfaced inline so users never lose sight of cost
- Delivery vs. collection toggle: two-button selector at top of checkout form; unique to SA context where community collection points serve low-infrastructure areas
- Payment section: card input with auto-formatting, expiry and CVV fields; currently UI-only, designed for PayFast integration
- Form validation: required fields highlighted in red with inline error banner if empty; prevents failed order submissions without full page reload (HTA step 1.5)

4.4 Wireframe 4: Smart Surplus, Confirmation & Farm Stories

Annotations:

- *Surplus page hero: countdown timer to deal reset, impact statistics (waste prevented, consumer savings), and email subscription form for early-access alerts*
- *Surplus product card: discount badge, urgency stock bar, "Only X units remaining" label, and orange accent border distinguish surplus items visually from standard listings*
- *Category filter chips: All / Vegetables / Fruit / Herbs / Organic filters allow quick narrowing of surplus deals*
- *Order confirmation page: full-width farm imagery, order reference number, "What happens next" timeline, and WhatsApp tracking button; closes the loop on HTA step 1.6*
- *Farm Stories grid: farmer photograph, narrative quote, years active, featured products, and dual CTA (browse produce / contact farm via WhatsApp); humanises the marketplace and reinforces the Farm Story feature motivation*

5. Unique Features

5.1 The Farm Story

The Farm Story is Green Bridge's proprietary innovation: a feature not present in any standard eCommerce CMS template, and one that directly addresses the root cause of consumer disconnection from South Africa's food supply chain. It was designed, written, and coded entirely as part of this project.

5.1.1. What It Is

The Farm Story is a rich, multi-element narrative panel embedded on every product detail page. Unlike a standard product description, the Farm Story is a human-centred content module that surfaces the farmer's identity, geography, philosophy, and growing practice. It transforms an anonymous commodity transaction into a relationship between a named producer and a conscious consumer.

5.1.2 Components of the Farm Story

- Farmer photograph and name: giving the producer a face and identity in the digital marketplace.
- Farm location: province and district, so consumers can see the geographical origin of their food.
- Farmer narrative: a first-person account (50-120 words) of the farm, their particular crop, and the farmer's values.
- Harvest timeline: a visual bar showing planting date, estimated harvest date, and days since harvest for the current listing.
- A direct 'Message the Farmer' button allowing pre-purchase questions via WhatsApp, reinforcing the direct relationship model.

5.1.3 Technical Implementation

The Farm Story is implemented in vanilla HTML, CSS, and JavaScript without any external libraries or AI-generated code. Each farmer's Story data is stored as a structured JavaScript object and rendered dynamically when a product detail page loads. The harvest timeline is a CSS-animated progress bar calculated from the listing's planting and harvest date fields.

5.2 Smart Surplus Alerts

While the *Farm Story* feature focuses on building trust and transparency between farmers and consumers, the Smart Surplus Alerts feature addresses a different but equally critical issue within the agricultural value chain: the loss of unsold produce and the inefficiency of matching supply with demand in real time. This feature introduces a responsive mechanism within Green Bridge that actively identifies and redistributes surplus produce, transforming potential waste into accessible, discounted opportunities for consumers.

5.2.1 What It Is

Smart Surplus Alerts is an adaptive pricing and notification system that responds to fluctuations in product availability. When a farmer has excess stock that is unlikely to sell at standard pricing, the system enables that produce to be repositioned as a time-sensitive offer. Rather than relying on static discounts, the feature ensures that surplus items are dynamically surfaced to consumers, increasing their visibility and likelihood of purchase. In doing so, it supports a more efficient marketplace where supply and demand are continuously aligned.

5.2.2 Components of the Smart Surplus Alerts

- Automated price adjustment: Once flagged, the system enables discounted pricing, clearly communicated through visual indicators on the product listing.
- Enhanced product visibility: Surplus items are prioritised within the interface, including placement in a dedicated “Surplus Deals” section and highlighted positions on the landing page.
- User notification system: Consumers receive timely alerts about newly available surplus deals, particularly for products they have previously viewed or purchased.
- Urgency-driven interface cues: Elements such as low-stock labels and limited-time messaging encourage faster purchasing decisions.

5.2.3 Technical Implementation

The Smart Surplus Alerts feature is implemented using standard web technologies (HTML, CSS, and JavaScript) without reliance on external libraries or pre-built CMS plugins. Each product listing includes a surplus status attribute within a structured data object. When a farmer flags an item as surplus, the system dynamically updates the product’s display properties, including

pricing, badges, and visibility in the “Surplus Deals” section. A JavaScript-based filtering function continuously scans product data and populates the surplus section in real time. Notification triggers are implemented using conditional logic that detects when surplus items are added or updated, prompting alerts to users based on their interaction history. Visual elements such as discount badges and urgency indicators are styled using CSS, with colour coding (e.g., green for savings, red/orange for urgency) to enhance visibility and user engagement. This lightweight implementation ensures that the feature remains scalable, efficient, and fully integrated within the platform’s core functionality.

6. Conclusion

Green Bridge represents more than a digital marketplace. It is a structural intervention in one of South Africa's most pressing socioeconomic challenges. By connecting small-scale farmers directly with urban consumers, the platform dismantles the intermediary dependency that has historically suppressed farmer income, inflated consumer prices, and contributed to significant food waste across the supply chain.

The two signature features developed for this project, the Farm Story and Smart Surplus Alerts, exemplify this philosophy in practice. The Farm Story transforms an anonymous transaction into a relationship between a named producer and a conscious consumer, addressing the opacity that erodes trust in the current food system. Smart Surplus Alerts tackle the food waste crisis at its source, creating a real-time feedback loop between excess supply and consumer demand. Together, these features do not merely differentiate Green Bridge from existing platforms; they embody the platform's core social contract with both farmers and consumers.

The UX design decisions documented in this report, from the icon-driven, low-literacy farmer interface informed by Hlumelo's persona to the trust-signal-rich consumer journey designed around Aaliyah's expectations, demonstrate that inclusive design is not a constraint on quality but a driver of it. A platform that works for a smallholder farmer in Mthatha on a mid-range smartphone will, by necessity, be fast, clear, and accessible for every user.

Green Bridge is, at its heart, a bridge not only between farmers and consumers, but between the South Africa that exists and a more equitable, food-secure, and digitally inclusive future. The platform is scalable, commercially viable as demonstrated by the Business Model Canvas projections and grounded in genuine social need. What began as an academic brief has produced a blueprint for meaningful impact: a homegrown solution, for Mzansi, by Mzansi.
